

Mountains of New Zealand

A listing based on
topographical merit
Edition 2.0 April 2013

*Mountains are the beginning and
end of all natural scenery*

John Ruskin 1819-1900

Credits and acknowledgements

Compiled and produced by Paul Clarke. Thanks to Ross Cullen for extensive review of the original listing, to Debbie Snelson for proof-reading and to Jeremy Smit for encouraging this new edition based on the NZTM grid-apologies that it has taken so long to produce.

Comments, suggestions and corrections are welcome. Please send them to mountainlisting@alpineclub.org.nz.

Where they lie...

The Tables

A	List by height	6
B	List by map sheet	24
C	List by national park	47
D:	Count by island and map sheet	56
E:	Count by national park	59
F:	Revisions	60

Key

* name is not exactly as marked on map

† 'marginal' peak may not meet topographical criteria as saddle height accuracy is limited to the contour interval

(range) parentheses are used to indicate that the mountain lies outside the area obviously covered by the range name on the map sheet, or the name of some other local geographical feature has been brought to bear. Only used where two peaks have identical names in order to distinguish between them

alta, altb indicates pair of adjacent peaks of same height separated by a non-qualifying col. Take your pick as to which one 'counts'

height height in metres

map sheet refers to Land Information New Zealand Topo50 series (1:50,000)

Lists and challenges

“How many mountains are there in New Zealand?” is a question to which there will never be a definitive answer, but hopefully these listings will stimulate conversation and debate, and suggest more than a few challenges for those willing to take them up.

The lists in these pages set out all those ‘mountains’ in New Zealand that meet two simple tests: first, that they reach an altitude of 1400 metres or more; and secondly, that they are at least 300 metres above the lowest saddle between them and the adjacent ‘mountain’. The first test was selected as the lowest rounded amount that would exclude all peaks that do not extend above the bush line. In the event two peaks in the Raukumara Range defy this expectation.

The second test was chosen to ensure that the mountains included are commandingly higher than their environs and are clearly separate mountains and not subsidiary peaks. 300 metres of re-ascent is a demanding test in this regard.

Challenges

The result is a list of 856 mountains: 34 are in the North Island and 822 in the South Island. There are some to whom any list is a challenge! What might those looking for a challenge take on from this one?

Most of the mountains are difficult and remote. Allowing time for weather, seasons, but not the need to make a living, a concerted attempt on them all will probably take a decade or three of continuous climbing! Here are some more plausible but still challenging suggestions:

- | | |
|------------------------------|---|
| The Big Target | The 71 at 2500 metres and over |
| The Trumper’s Century | Any 100 |
| The Grand Tour | 118 being any one from each of the map sheets |
| The Local Blitz | All the mountains in your local or favourite National Park. Neighbours of Fiordland and Aspiring could reasonably settle for the highest or any 50. |

Pick one of these or make up your own and give it a go – and let us know when you’ve done it!

What's missing?

Of course, any listing that identifies mountains formulaically (or any other way for that matter) will carry a certain arbitrariness. This one is no exception, and leaves out a number of peaks that might make a claim for consideration. Some of these are:

- A number of rugged peaks of south and west Fiordland where the heights fall below 1400 metres.
- Several very long ridges where there is insufficient undulation to provide 300 metres of re-ascent leading to situations where the adjacent mountains are 20 km apart or more. Examples include the Two Thumb Range, east of the Macaulay river and the bounds of the Dobson river.
- Numerous peaks that are either very beautiful, or provide fine climbs, or a varied challenge. *The 100 Peaks Challenge* prepared by the New Zealand Alpine Club's Otago section to mark the Club's centenary in 1991 is the premier listing in this regard. It was published in the Nov/Dec 1990 NZAC Bulletin and a copy is available on the New Zealand Alpine Club's website – alpineclub.org.nz.
- Some of the very highest peaks – those above 3000 metres – where precedent considers all separately named peaks as mountains and not subsidiaries. A list on this basis was prepared by Don French in *Climber* magazine in April 1994 and reproduced with minor corrections in *Wilderness* magazine in January 2002. The highest such peak omitted here is Mt Dampier 3440 metres, 92 metres above Green Saddle that separates it from Mt Cook.

Route Database

A comprehensive route database which incorporates the mountains in this listing and many of the others referred to above is at climbnz.org.nz.

Clusters & outliers

Undoubtedly the most jagged area is northern and central Fiordland, with the Homer Saddle map (Sheet CB08) having the most mountains, followed by its neighbour Hollyford (CB09). The next most fertile area for finding mountains is the area to the west of the Haast Pass, particularly the bounds of the upper Wilkin and Young rivers.

In both of these areas, traversing between peaks is generally very difficult. The most promising area for rapid mountain bagging is the Mt Owen plateau in Kahurangi, where four mountains are in easy distance of Gracity Pass Hut.

The closest pairs are:

- **Mt Action** and **Mt Victor** 1.06 km apart in Mt Aspiring National Park, separated by The Gateway

- **O’Leary Peak** and **Mt Earnslaw/Pikirakatahi East Peak** 1.12 km apart in Mt Aspiring National Park, separated by Wright Col (they are closest of the pairs over 2500 metres of altitude)
- **Mt Williams** and **Mt Percy Smith** 1.47 km apart on the Main Divide near the head of the Hopkins Valley
- **.1552** and **.1480** 1.47 km apart in Skippers Range above Lake McKerrow in Fiordland National Park
- **Mt Pollux** and **Mt Castor** 1.50 km apart in Mt Aspiring National Park
- **.1577** and **Mt Soaker West** 1.62 km apart, to the east of Doubtful Sound in Fiordland National Park.

Progressively restricting the set by altitude thresholds increasing in 100 metre bands, one other pair is notably close: Malte Brun and Mt Hamilton in Aoraki Mt Cook National Park are the closest pair among those above 2600 metres – they are 2.2 km apart and are in fact both over 3000 metres. Above 3100m the closest pair is Aoraki/Mt Cook and Mt Tasman.

Of all the mountains listed, the most isolated from its neighbours is Summit Rock in the Rock and Pillar Range 46 kms from its neighbour Mt Pisgah in the Danseys Pass area. The next most isolated is .1435 a north-western outlier of the Ruahines which is 28 km from Rongotea in the same range.

Again taking mountains above altitude thresholds increasing in 100 metre bands, others notably remote from their neighbours of similar or greater height are Mt Taranaki/Mt Egmont, and Mt Murchison in Arthur’s Pass National Park. Mt Aspiring/Tititea is more than 150 kms from the other 3000 metre peaks.

Technical notes

- Mapping** The primary data source is Land Information New Zealand Topo50 maps at 1:50,000 scale mapping. Reference was made to the now obsolete Series 262 1:250,000 scale mapping in determining the extent of ranges.
- Revision** The first edition of this listing was based on Land Information New Zealand Series 260 mapping. The primary reason for this new edition is that this series has been replaced by the Topo50 series which uses a different grid system. In preparing the second edition a number of revisions to spot heights and mountain names in the Topo50 maps have been noted and incorporated. In checking all the grid references, heights and names, a number of errors in the first edition were noted and have been corrected. All these changes are summarised in Table F. The original work of identifying all relevant mountains was not repeated.

Heights	For all mountains identified, spot heights are available and these are the heights given. All heights are in metres.
Saddles	In most cases, spot heights for saddles are not available, and saddle height could only be identified as falling in a 20 metre contour interval. In 35 cases, there is resulting uncertainty as to whether peaks meet the 300 metres of re-ascend criteria. These peaks have been included in the tables, but identified as such. They have been given full status in determining rankings.
Alternates	In nine cases, two adjacent peaks with a ‘non-qualifying’ saddle between them have identical spot heights. In these cases, both are shown in the tables, but the pair only count once for ranking purposes.
Names	Where available, mountain names have been taken from the LINZ mapping exactly as listed. A large portion of the mountains are only identified by spot heights. In a number of these cases, mountains are near or adjacent to named peaks. Where appropriate these names have been used with embellishments ‘...NW Peak’, ‘South...’ etc. In a handful of cases the names used have been derived from other nearby geographic features such as ridges. In no case have truly original names been used. In all cases where the name is not exactly as listed on the LINZ mapping, this has been identified in the tables, and may need to be taken into account when locating the peak on the map.
Grid references	Grid references were taken from calibrated electronic versions of the maps and rounded to the nearest multiple of 100 metres. Amounts up to and including 50 metres have been rounded down. In some cases amounts up to and including 950 metres and a bit more have been rounded down to 900 metres to keep them in the ‘right’ grid square.
Ranges	Although in many cases, range names are given on the map sheets, the extent of the area to which the name applies is not clear. Where there is any ambiguity, a conservative approach has been taken and the range name not used. An exception to this conservative approach has been made for clarity where two or more mountains share the same name. In a few instances the name of some other local geographic feature has been bought to bear for this purpose where there does not appear to be a range name. The ‘Southern Alps’ appear variously on the maps as ‘Southern Alps’, Main Divide of the Southern Alps’, and ‘Ka Tiritiri O Te Moana’. For consistency ‘Southern Alps’ has been used throughout and only applied to mountains on or very near the Main Divide. Anyone trying to rationalise range names has to contend with such perplexities as Mt Somers being near, but clearly not on, the Mt Somers range.
Verification	It is inevitable in a project of this nature that the listings will contain errors. Please send any corrections or amendments to mountainlisting@alpineclub.org.nz .
National Park boundaries	The inclusion of peaks within or on National Park boundaries has been determined using the Parkmap 273 series Parkmap.

Table A List by Height

Table F Revisions

This second edition has primarily been prepared to reflect the introduction of the NZTM grid. The process of checking the revised map references against NZTM series maps has led to a number of revisions and corrections as set out below. Note that NZTM series maps were not further reviewed to ascertain whether any additional mountains meet the criteria or any existing mountains no longer meet the criteria as a result of further revisions. Apologies to anyone who has climbed a mountain purely because it was in Edition I, only to now find their endeavours were in vain.

Ed I Rank	Ed I Name	Ed I Grid	Revision	New Name	New Height	New Grid
3	Malte Brun	I36 923348	Height revised - incorrectly recorded in Ed I		3199	
15	Hochstetter Dome E*	I35 957416	Height revised - incorrectly recorded in Ed I		2827	
16	Mt Earnslaw	E40 459105	Name revised - alternate name on new map	Mt Earnslaw/ Pikirakatahi East Peak		CA10 359487
